What we're going to talk about

Why we need to figure out risk management in large agile projects

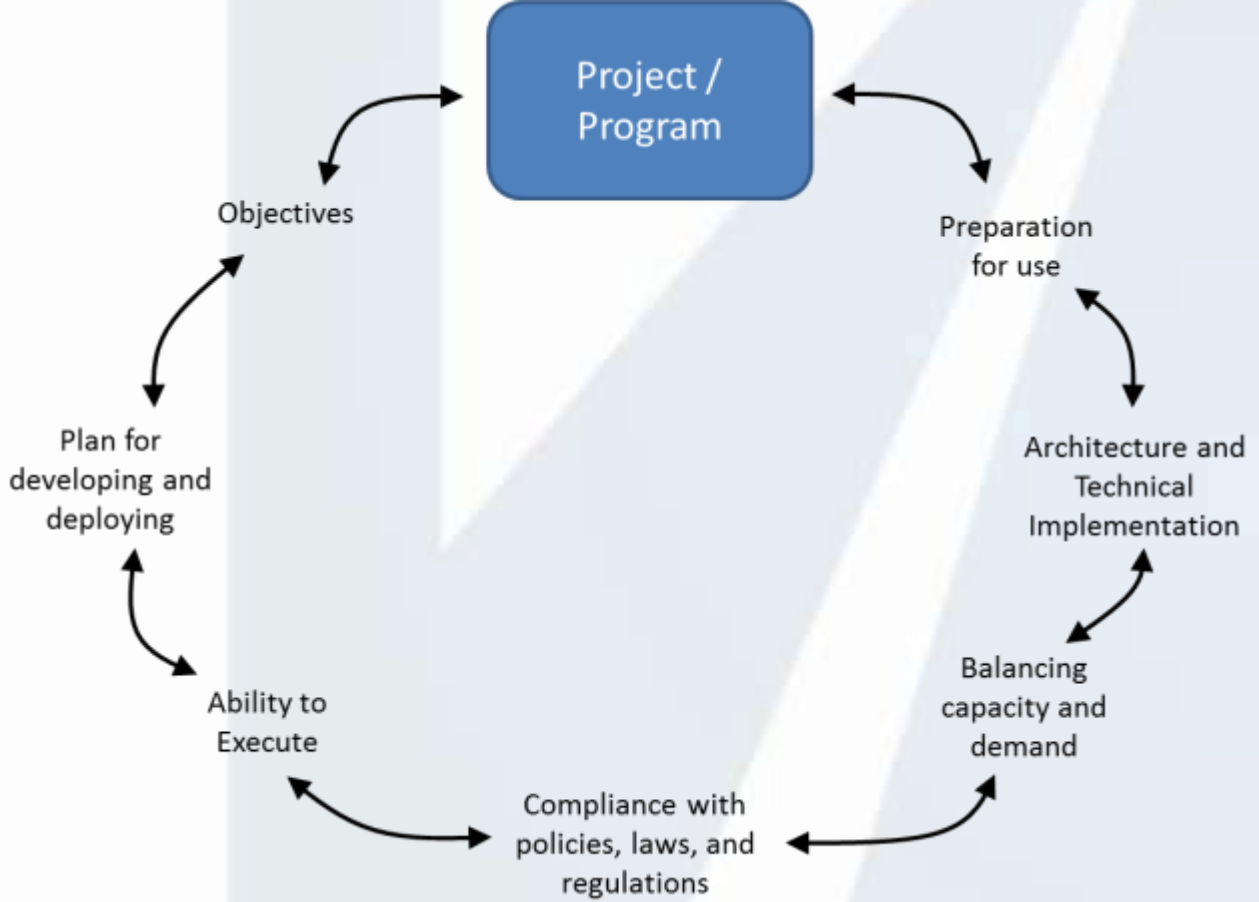

Practice a proven approach

- Define Risk Drivers
- Agile Risk Assessment
- Integrate Risk Management

Explore Quantitative approach

- Nature and shape of risk impact
- Simulating impact of cost of delay and risks

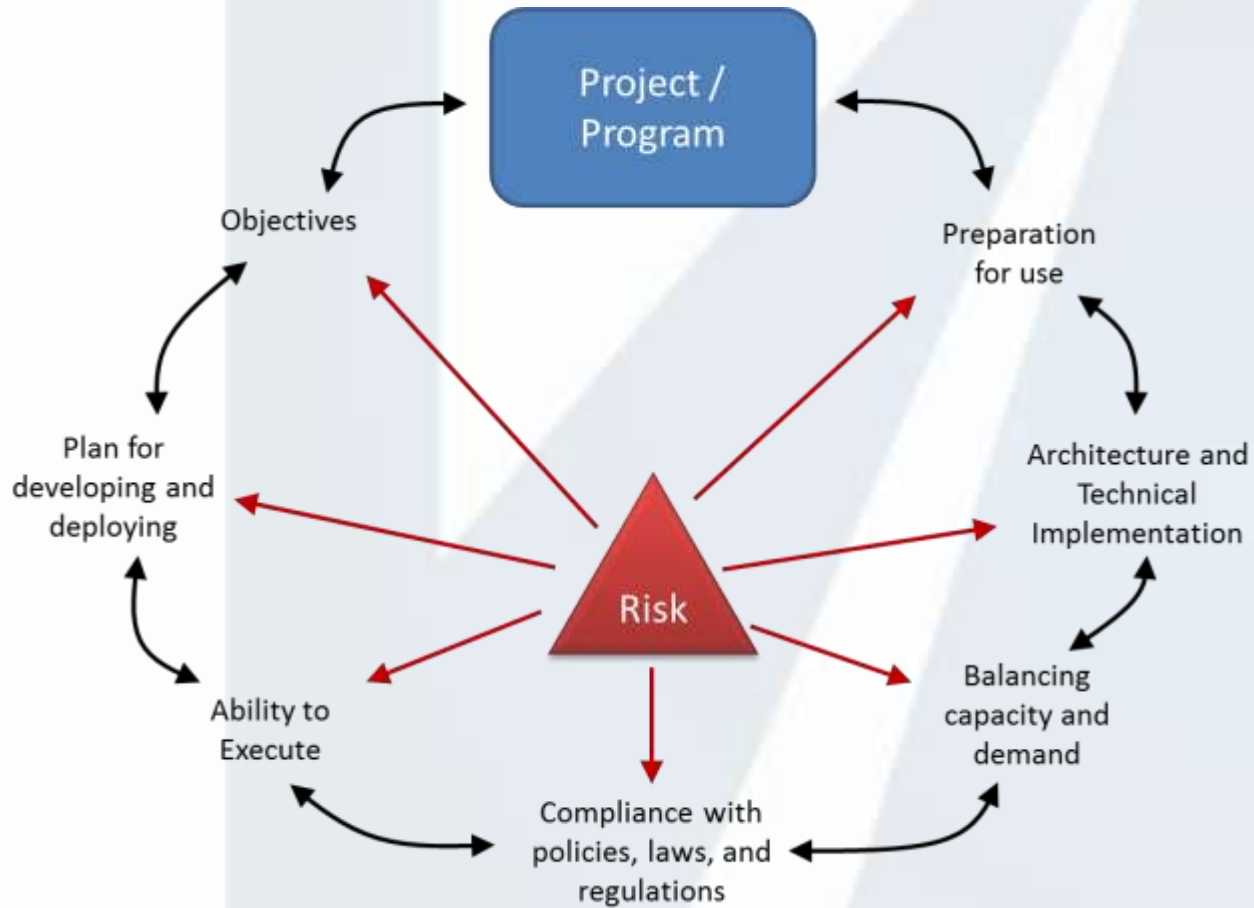

Decisions are made throughout a project

Decision making is impacted by many factors

- Available Information
- Uncertainty about **C**onsequences
- Awareness of Alternatives
- What **C**ontext we are paying attention to
- When the decision is made and how much **T**ime we have to make the decision
- **U**ncertainty about the desired outcomes
- Conflicting concerns among **S**takeholders

Decisions are interdependent

A decision in one area may reveal or create other problems in other areas.

Risk Management

Risk

The likelihood of suffering a loss or missing an opportunity

Risk Management

How decisions are made under uncertainty during the project to:

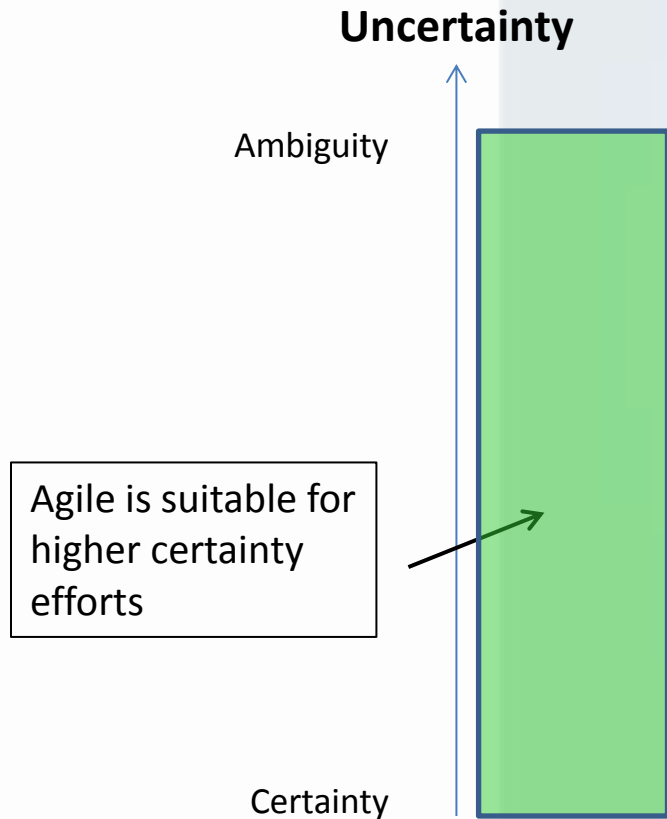

- avoid losses on the project that are avoidable, and
- benefit from opportunities that arise during the project

Risk Management in Agile

Agile has risk management implicitly built in

- Feedback cycles (Product, Progress, Process, and Capability) are built in throughout the agile cadence
- Co-located teams (individuals and interactions) facilitate shared understanding
- Agile teams may explore alternatives through spikes and dialog
- Continuous delivery of working-tested software

Agile Implicit (built-in) Risk Management

When practiced by mature agile practitioners in a co-located environment on relatively small projects –implicit risk management may be appropriate

Limits of Agile Risk Management

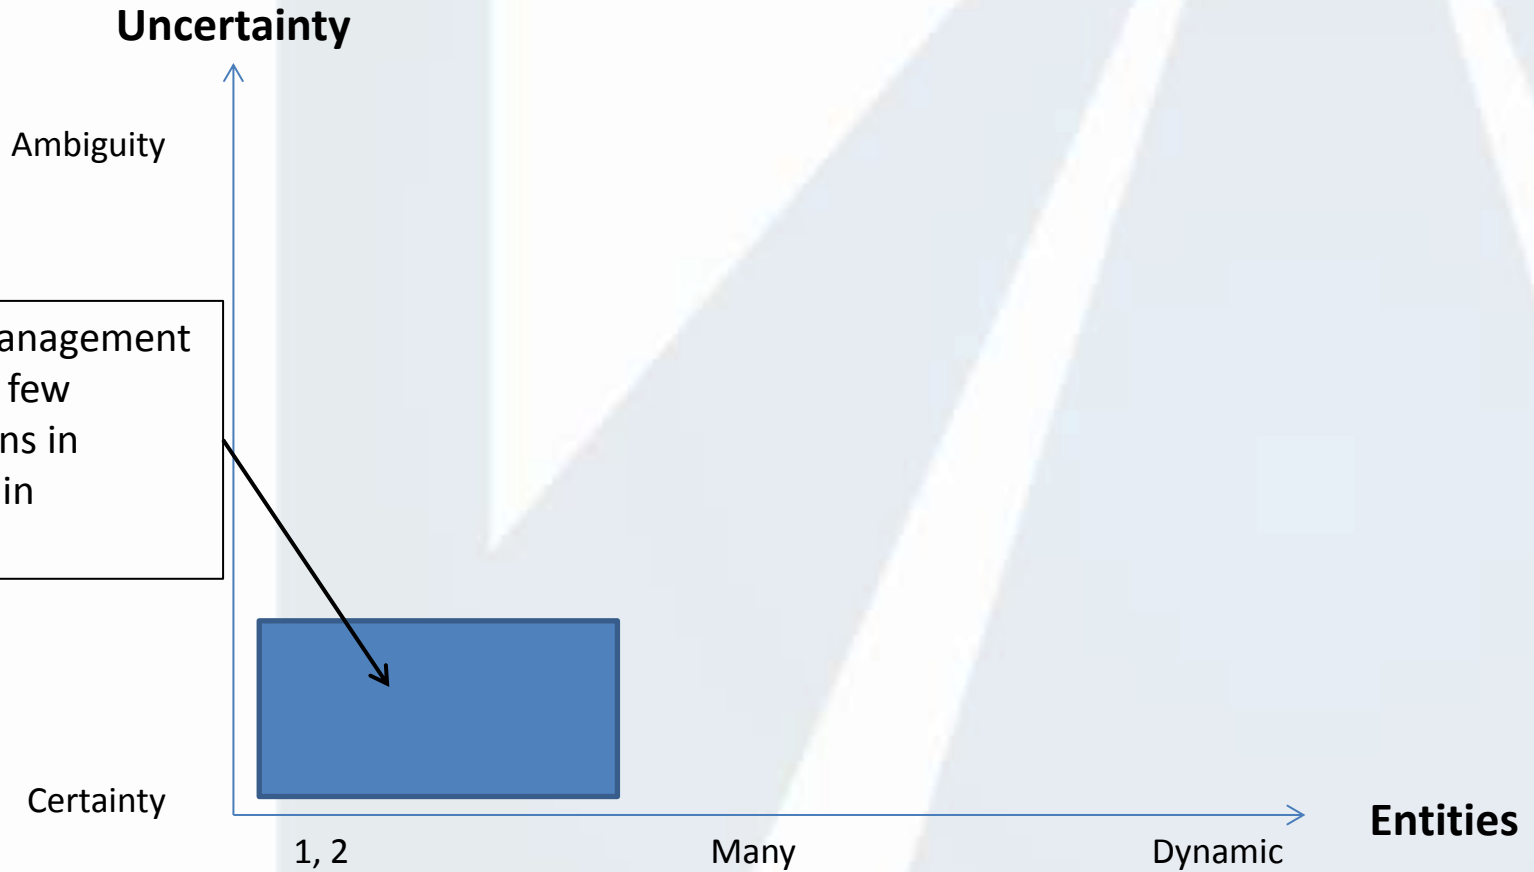

- Can miss important aspects of the program outcomes that are outside the teams line of sight
- Makes is difficult to measure the risk impact
- Can encourage pushing risky things off so we can maintain an optimistic burn-up
- Often is tactical in nature – focusing on a local effect without a clear connection to the outcomes

“Traditional” Risk Management

Risk Management in Many Organizations

- Tactical in nature
- Focuses on threats and the direct consequences of the threat
- Driven by bottom up analysis
- Often identified, assessed and managed independently of the teams executing the work

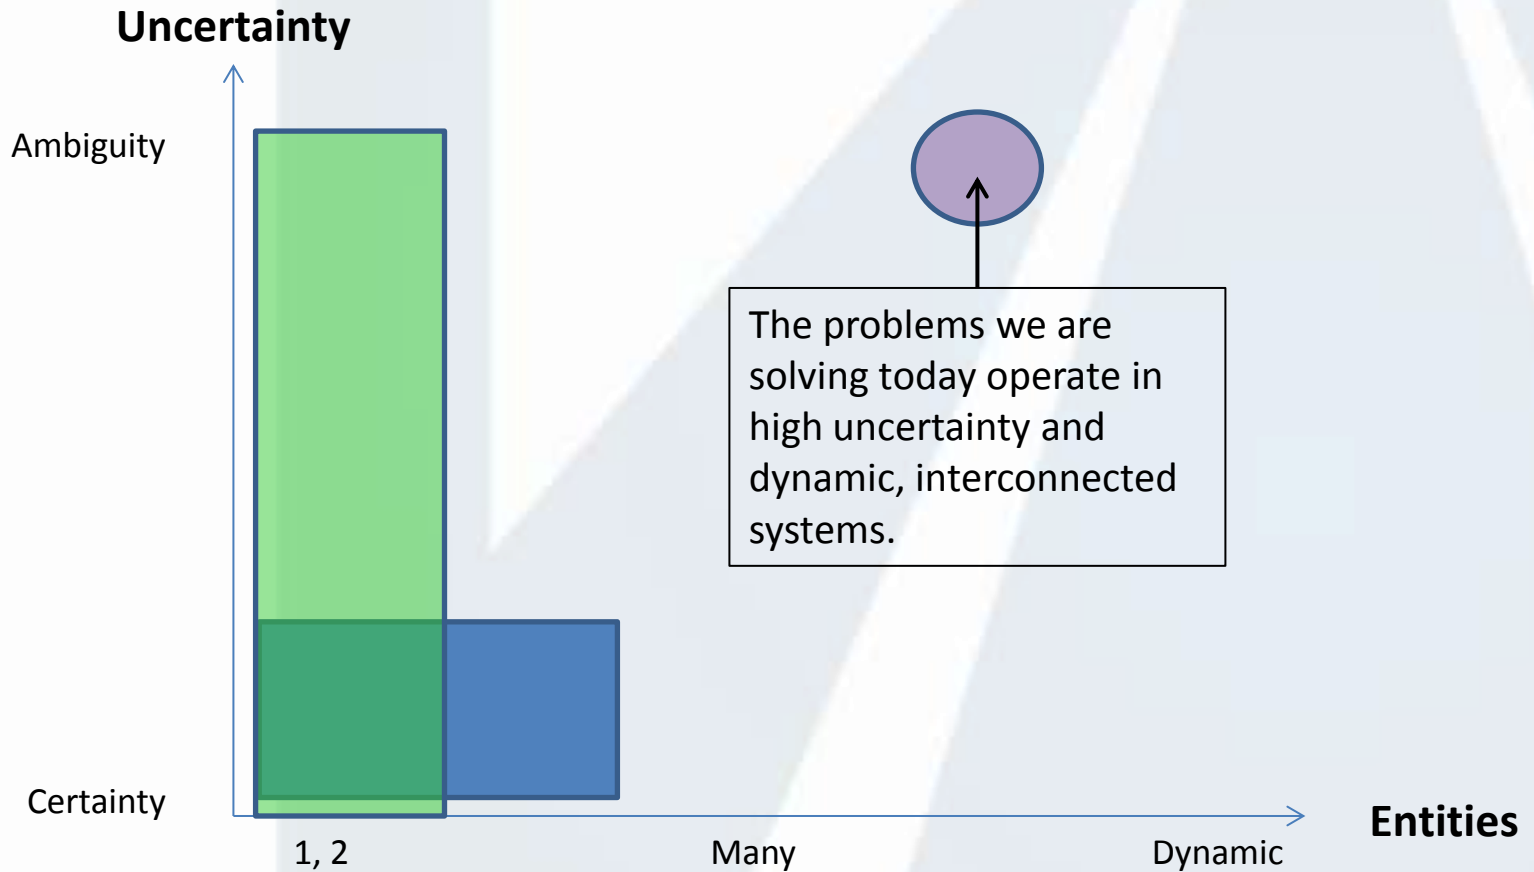

Tactical approach to risk management

Limits of Traditional Risk Management

- Creates bureaucratic overhead
- Managing point solutions mean that the risk impact may not be closely connected to objectives
- Significant gaps in ability to handle ambiguity and emergence
- Ineffective integration of risk-management
- Often ignores opportunities

Insufficient approaches to risk management

What is needed

To handle scale

- Explicit risk management
- Systemic view of risk

To handle ambiguity

- Continuous risk management
- Integrated with the work and the team
- Exploits opportunity as well as avoids threats

What I've drawn on for this approach

Significant Experience with Agile in the Enterprise

SEI-CMM research into Systemic Risk Management (MOSIAC)

Lean-Startup, particularly validated learning, scientific experimentation, and iterative product releases

Modeling and Forecasting using Monte Carlo techniques

Risk Management for Agile in the Enterprise

- Identify Risk Drivers
 - Identify objectives
 - Determine risk drivers
- Agile Risk Assessment
 - Assess against risk drivers (Threats and Opportunities)
 - Risk profile / burn-down
- Integrate Risk Management
 - Plan responses
 - Risk board
 - Acceptance criteria

How to simulate , measure and understand how risk impacts delivery

SHAPE OF RISKS TO COME

Risks and Shape

- Simple Model
- Base Scope of 50 stories – Always Normal
- 5 Risks, each with
 - 25% Likelihood
 - 10 Stories (same as 20% scope increase each)

```
<backlog type="custom">
  <deliverable name="Base">
    <custom count="50" />
  </deliverable>
  <deliverable name="Delay1" skipPercentage="75">
    <custom count="10" />
  </deliverable>
  <deliverable name="Delay2" skipPercentage="75">
    <custom count="10" />
  </deliverable>
  <deliverable name="Delay3" skipPercentage="75">
    <custom count="10" />
  </deliverable>
  <deliverable name="Delay4" skipPercentage="75">
    <custom count="10" />
  </deliverable>
  <deliverable name="Delay5" skipPercentage="75">
    <custom count="10" />
  </deliverable>
</backlog>

<columns>
  <column id="1" estimateLowBound="1" estimateHighBound="3" wipLimit="2">Work</column>
</columns>

<forecastDate startDate="01-May-2012" costPerDay="2500" />
```

Historical Story Lead Time Trend

Sum Random Numbers

Basic Lean Forecast Monte Carlo Process

1. Gather historical story lead-times
2. Build a set of random numbers based on pattern
3. Sum a random number for each remaining story to build a single outcome
4. Repeat many times to find the likelihood (odds) to build a pattern of likelihood outcomes

$$\text{Total Days} = \frac{\text{Sum} (\text{Story}_n \times \text{Random}_n)}{\text{Effort}}$$

Sample Count: 1000 Min: 58 Avg: 64.185 Median: 64 Max: 70 Standard Dev: 1.94

5th %: 61 25th%: 63 75th%: 66 95th%: 67

Histogram

Sample Count: 5000 Min: 58 Avg: 67.344 Median: 65 Max: 83 Standard Dev: 5.747

5th %: 62 25th%: 63 75th%: 72 95th%: 78

Histogram

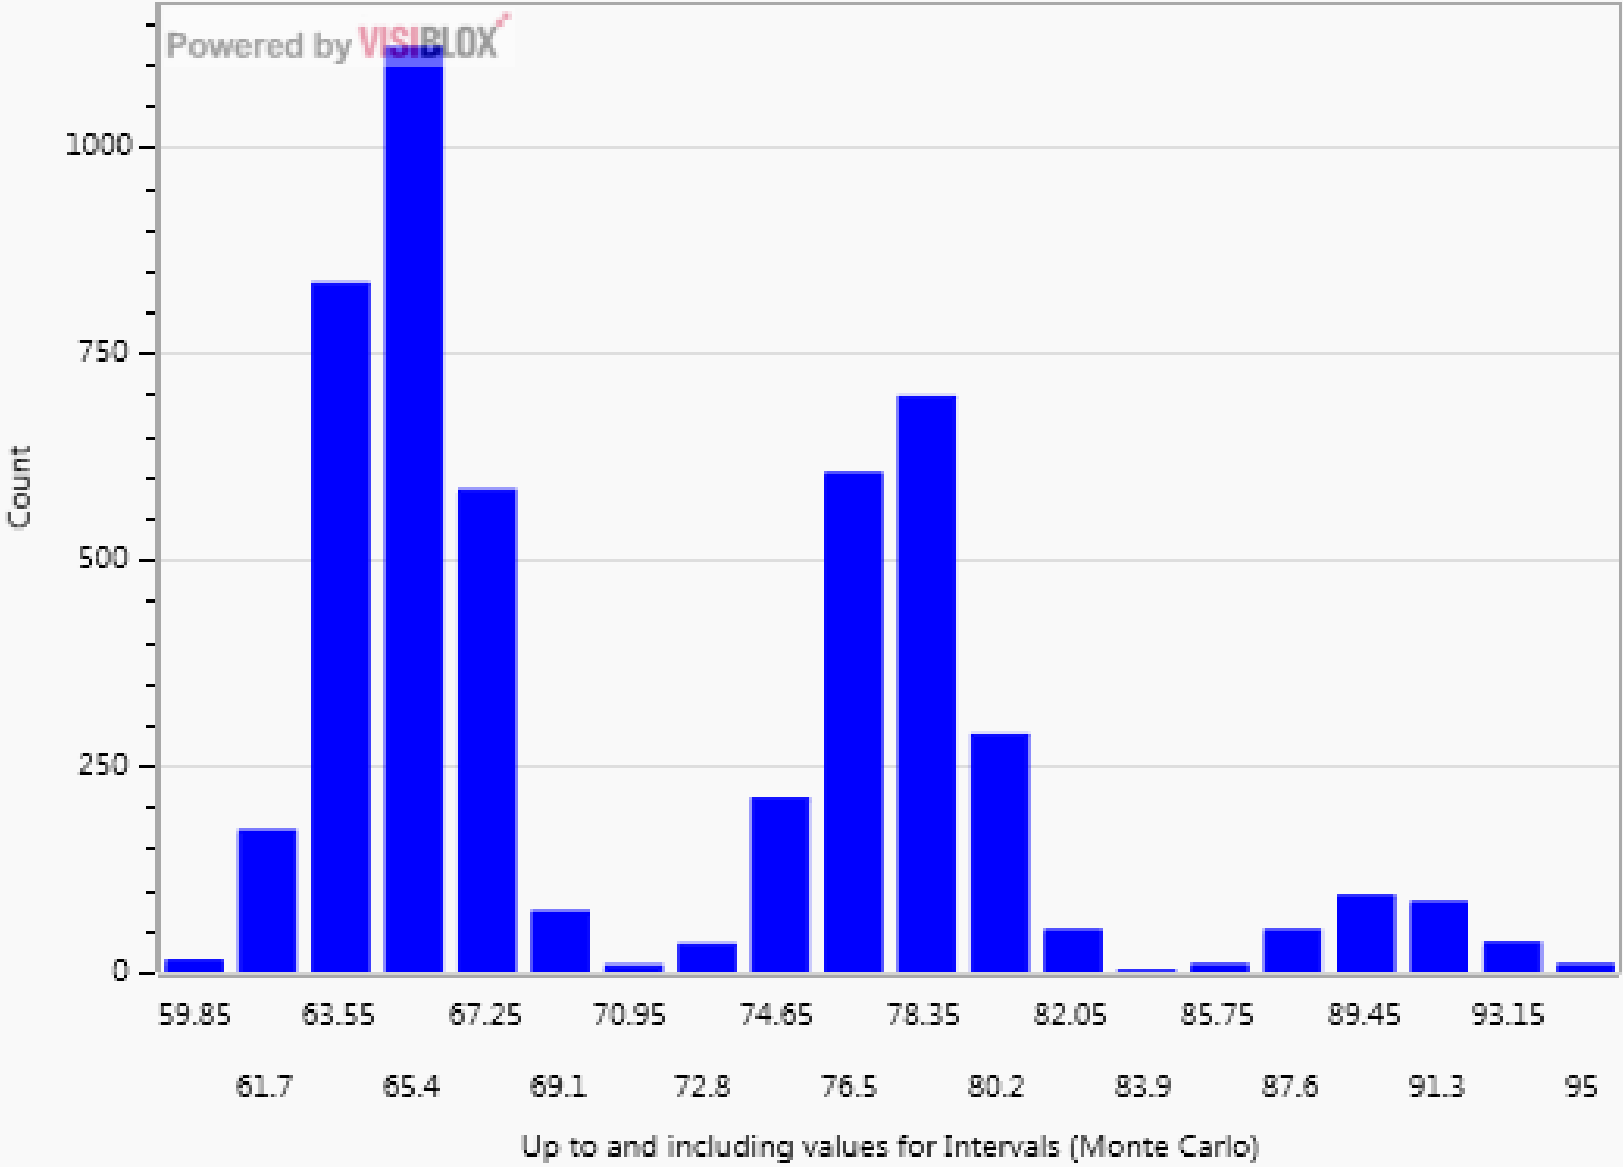

Up to and including values for Intervals (Monte Carlo)

Sample Count: 5000 Min: 58 Avg: 70.376 Median: 66 Max: 95 Standard Dev: 7.836

5th %: 62 25th%: 64 75th%: 77 95th%: 87

Histogram

Sample Count: 5000 Min: 59 Avg: 76.941 Median: 77 Max: 118 Standard Dev: 10.766

5th %: 62 25th%: 66 75th%: 86 95th%: 93

Histogram

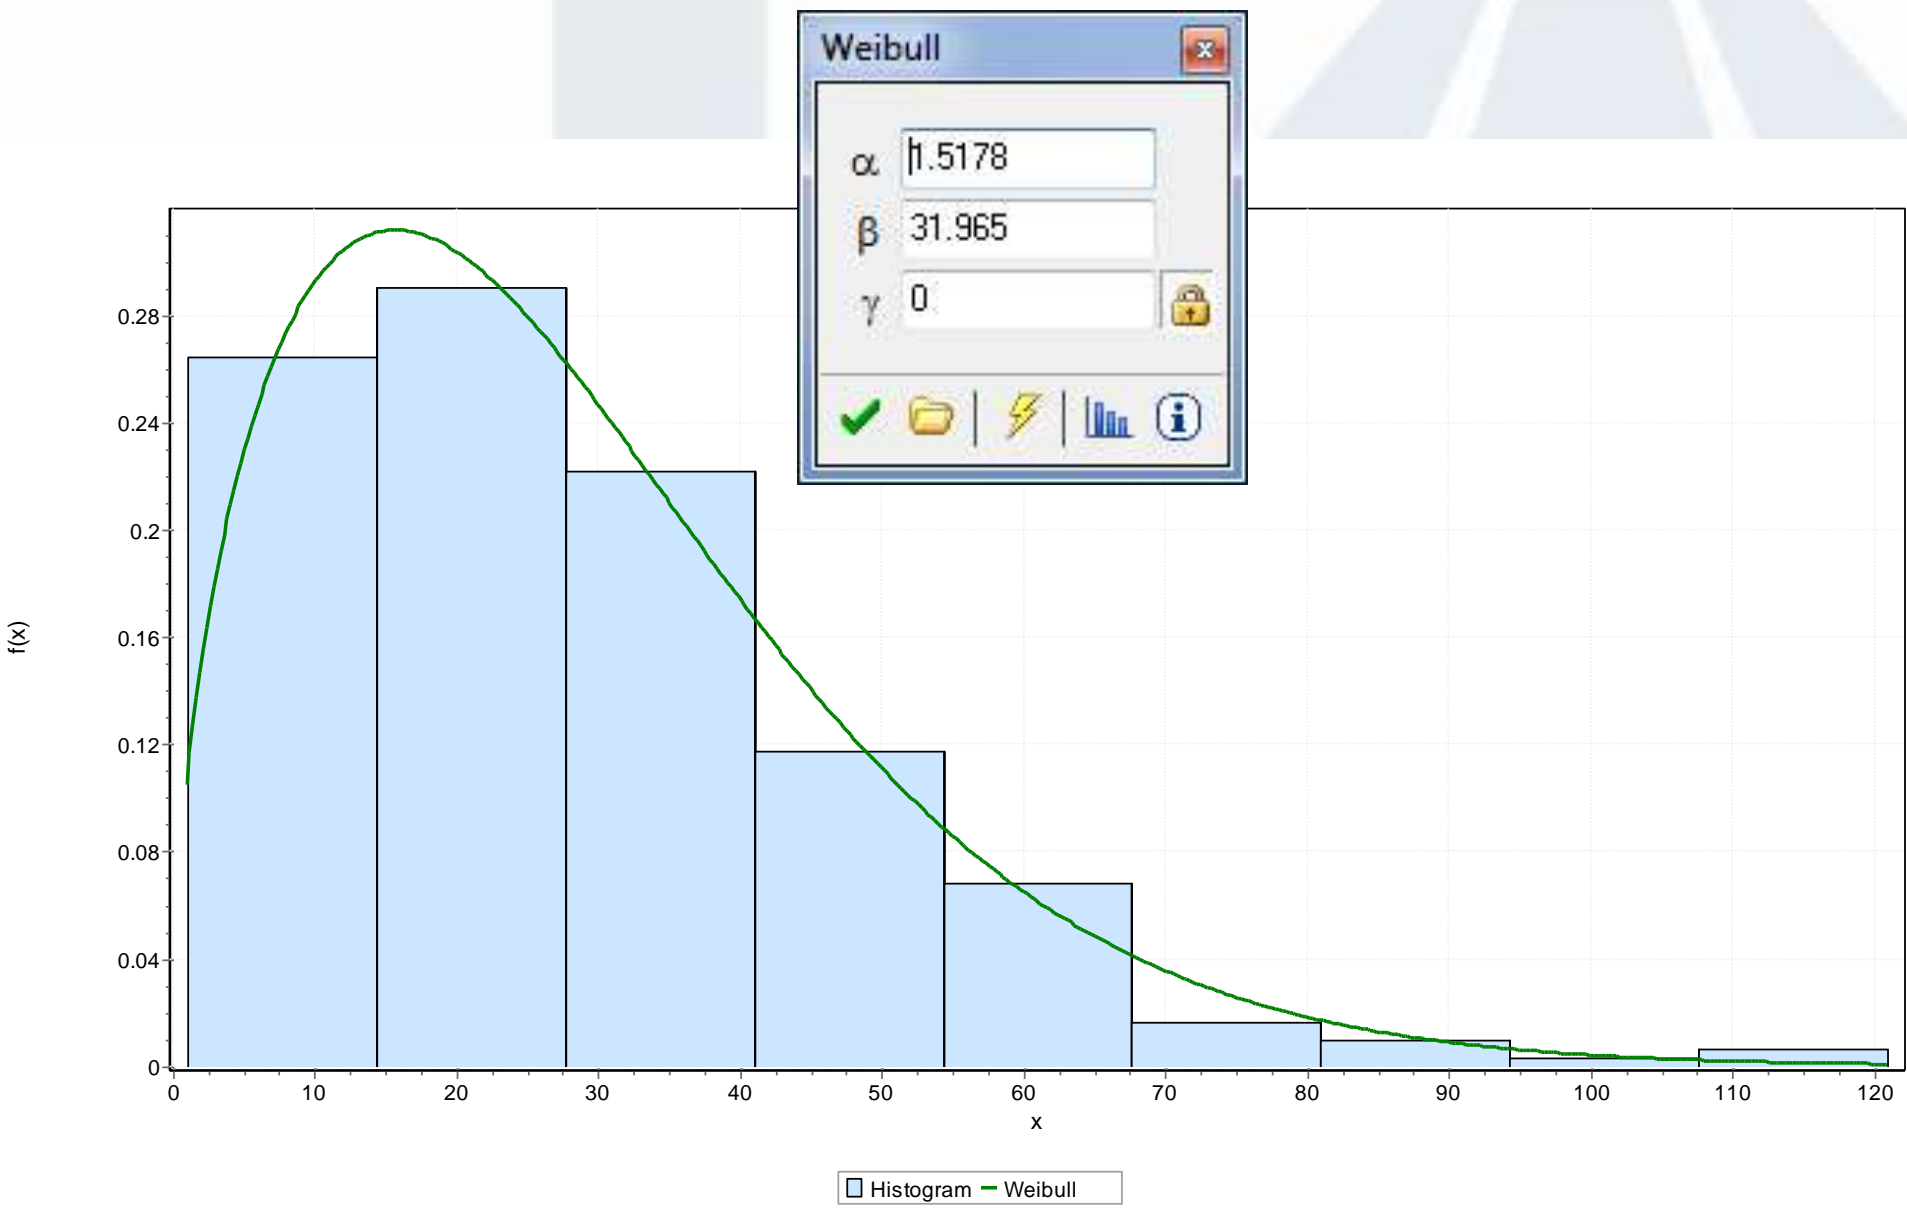

Sample Count: 5000 Min: 58 Avg: 79.931 Median: 78 Max: 131 Standard Dev: 12.247

5th %: 63 25th%: 74 75th%: 89 95th%: 103

Histogram

Risk Impact in Work Days

Risks in play	Work Days to 85% +	Additional Work Days
None	65	0
1	78	13 (+20%)
2	91	26 (+40%)
3	103	39 (+60%)
4	116	52 (+80%)
5	129	65 (+100%)

IDENTIFY RISK DRIVERS

Define the Objectives

Product

- Functional, Performance, Operations, Usage, Maintainability, Deployment, Transition

Business

- Financial, Market, Adoption, Satisfaction

Constraints

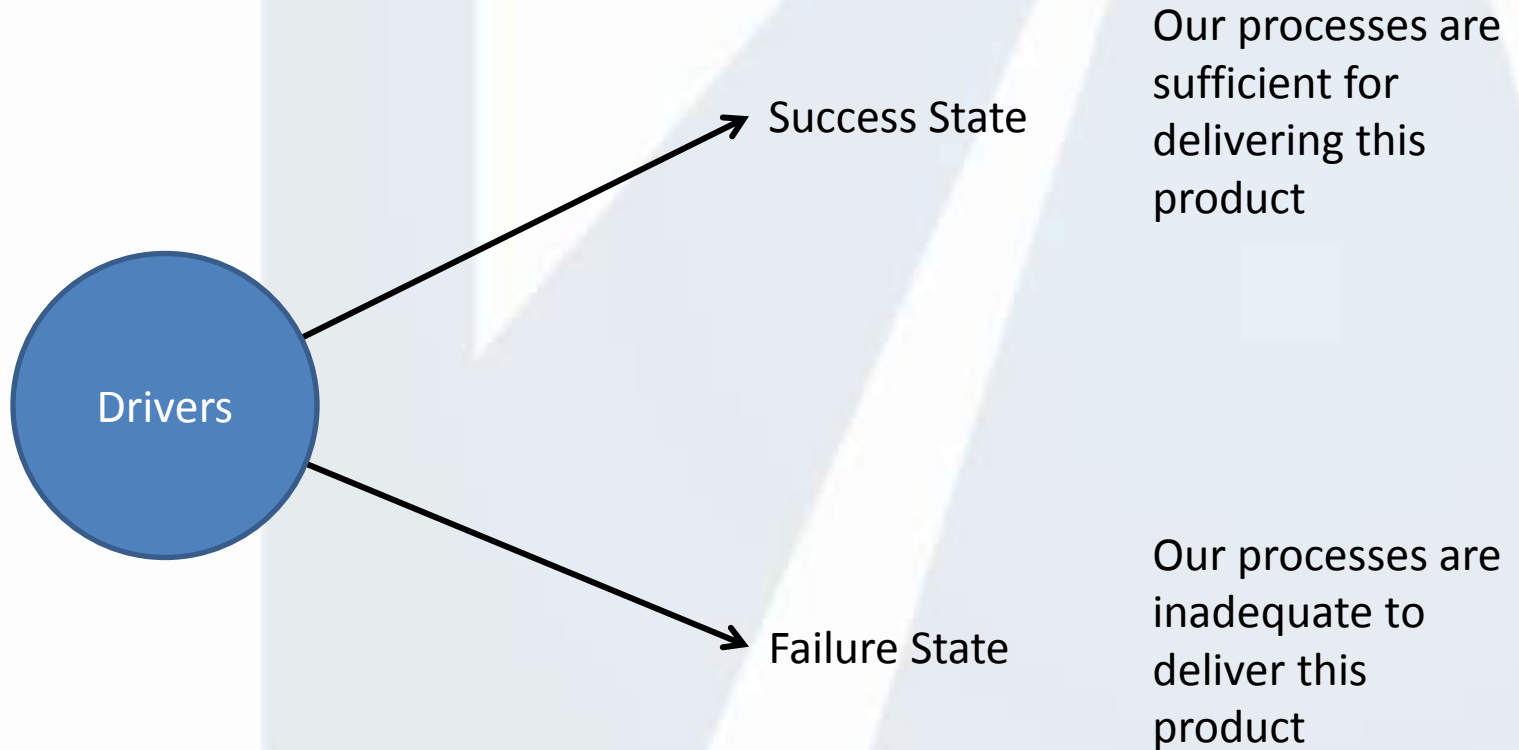

- Cost Constraint, Schedule Constraint

Risk Drivers

- A driver is a factor that has a strong influence on the eventual outcome or result
- Drivers enable a continuous systemic approach to risk management
- Effects of conditions and potential events can be aggregated across a program

Risk Drivers

Risk drivers are stated from a success state and a failure state.

Risk Driver Starter

- Mosaic defines 20 drivers in 6 categories
 - Seems like a lot from an Agile standpoint
- I have used two – internal to team external to team
 - Has proven to be too light
- I am currently using five
 - Business
 - Technical
 - Feedback
 - Organizational
 - Dependency

Identify Risk Drivers

- Do this with the same group who is doing Release and/or Program Planning
- Tailor the drivers to your effort
 - Remove extraneous drivers, add missing drivers to the list, combine or decompose drivers so they make sense to the team
 - Write a success condition statement and a failure condition statement
 - Adjust the wording in each driver to be consistent with the programs language

Business Risk Drivers

Consider

- Clear Objectives
- Customer / End-User Understanding
- Appropriate Requirements
- Plan and Constraints
- Adoption Barriers
- Trimming the Tail
- Pivoting
- Operational Preparedness

Business Driver

Customer Understanding

Success State:

The product is appealing to consumers and increases customers using automated systems for bank deposits

Failure State:

The product is viewed as threatening or unreliable to customers and more customers use the bank and drive through for deposits

Technical

Consider

- Development Tools and Technologies
- Technical Execution Ability
- Design and Architecture
- Delivery Process (Design, Develop, and Deploy)

Technical Driver

Development Tools and Technologies

Success State:

The tools and technologies are sufficient to support the delivery of the solution

Failure State:

The tools and technologies hinder the delivery of the solution

Feedback

Consider

- Technical Performance
- Fit to Need
- Compliance Testing
- System Capability
- System Integration
- Operational Support
- Certification and Accreditation

Feedback Driver

Technical Performance

Success State:

Our test environments, test data management, and test deployment are suitable to gathering rapid feedback to ensure technical excellence is delivered

Failure State:

Test environments, test data management, and test deployment contribute to delays that cause the program to fail.

Organization and Environment

Consider

- Staffing and Team Stability
- Coordination
- Project Management
- Facilities and Equipment
- Organizational Conditions
- Political Concerns

Organization and Environment Driver

Staffing and Team Stability

Success State:

Our teams are fully staffed with analysts, testers, and engineers so they become high performing teams

Failure State:

Testers are pulled onto many projects and there is significant churn on the project from holding completed code that can't be tested when completed

Dependency

- Suppliers, Partners or Collaborators
- Applications
- Software
- Systems or Sub-systems
- Hardware
- Legal, Compliance, etc

Dependency Driver

Hardware

Success State

The scanners in the ATM machines consistently produce a high quality of input

Failure State

Scanners in ATM machines are not calibrated sufficiently to balance between fraudulent deposits and satisfactory scans

ASSESS RISKS

Identify Events for each Category

- Working with the whole team – identify events that could influence the success state or the failure state
- This can look like story mapping

Hardware

Failed Implementation: We invest in the product and we can't implement it in the field because the scanners are bad.

Reduce Time: We may be able to reuse the Image Interpretation software from SOG to overcome deficiencies in the scanners.

Risk Management in Release Planning

Evaluate Risk Events

Impact

Likelihood

	Small-1	Medium-3	Big-5
Low-1	1	3	5
Medium-3	3	9	15
High-5	5	15	25

Risk	Likelihood	Impact	Risk Score
Failed Implementation: We invest in the product and we can't implement it in the field because the scanners are bad.	3	5	15
Reduce Time: We may be able to reuse the Image Interpretation software from SOG to overcome deficiencies in the scanners.	3	3	9

Risk Burn-Down

The risk burn-down measures the rate we are reducing the total risk score for a project.

You probably want to burn down risk faster than your features are burning up

Workshop #2 discussion

Based on the Feature Burn-up, which project is in better shape?

Feature Burn-up

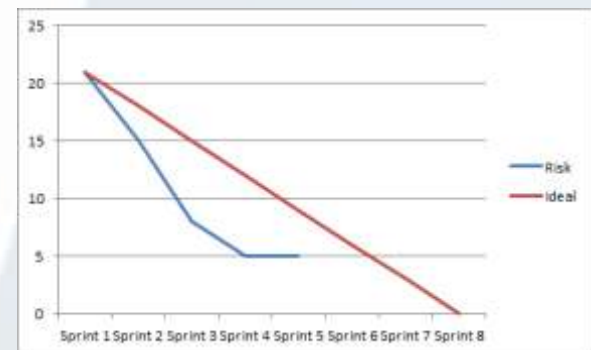

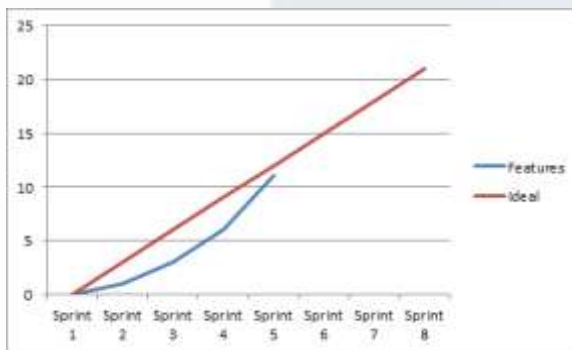

Workshop #2 discussion

With the Risk information incorporated, which project is in better shape?

Feature Burn-up

Risk Burn-down

Assessing the Risk Profile

- Driver State
 - Driver is almost certainly in its success state
 - The driver is most likely in its success state
 - The driver is equally likely in its success and failure state
 - The driver is most likely in its failure state
 - The driver is almost certainly in its failure state

Risk Profile

Driver is almost certainly in its success state					X	
The driver is most likely in its success state	X	X				
The driver is equally likely in its success and failure state			X			
The driver is most likely in its failure state				X		
The driver is almost certainly in its failure state						
Status	Business	Technical	Feedback	Organization and Environment	Dependency	

10%

50%

90%

```
<backlog type="custom">
  <deliverable name="Base">
    <custom count="50" />
  </deliverable>
  <deliverable name="Delay1" skipPercentage="75">
    <custom count="10" />
  </deliverable>
  <deliverable name="Delay2" skipPercentage="75">
    <custom count="10" />
  </deliverable>
  <deliverable name="Delay3" skipPercentage="75">
    <custom count="10" />
  </deliverable>
  <deliverable name="Delay4" skipPercentage="75">
    <custom count="10" />
  </deliverable>
  <deliverable name="Delay5" skipPercentage="75">
    <custom count="10" />
  </deliverable>
</backlog>
```

Each Risk Driver is modeled separately and quantified as to delay if realized

Each Risk Driver likelihood is modeled based on profile score

Speaking Risk To Executives

- Buy them a copy of “Flaw of Averages”
- Show them you are tracking & managing risk
- Do
 - “We are 95% certain of hitting date x”
 - “With 1 week of analysis, that may drop to date y”
 - “We identified risk x, y & z that we will track weekly”
- Don't
 - Give them a date without likelihood
 - “February 29th 2013”
 - Give them a date without risk factors considered
 - “To do the backlog of features, February 29th, 2013”

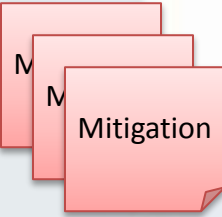

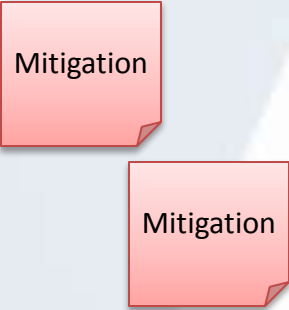

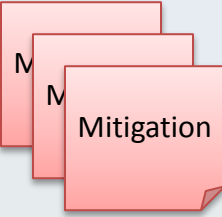

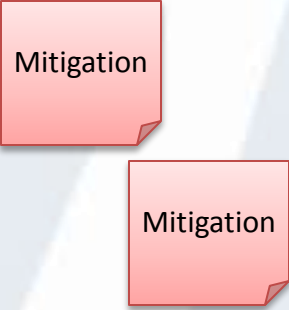

INTEGRATED RISK MANAGEMENT

Integrated Risk Management

Identify, Assess, Create Response, Apply Response, Risk Retired, and Monitor

- Risk Stories Integrated into Backlog
- Risk Management Board
- Track Items to Monitor
- Integrate Review of Risk Drivers into Ceremonies
- Acceptance Criteria

Risk Board

Ready	Doing	Done	Retired
 <p>Risk</p>	 <p>Mitigation</p>	 <p>Mitigation</p>	 <p>Risk</p>
 <p>Risk</p>	 <p>Mitigation</p>	 <p>Mitigation</p>	<p>Monitor</p> <p>Capacity Compromised Requirements Churn Late Delivery from SOG</p>

Questions and Discussion

Risk Management for Agile Projects

- Identify Risk Drivers
 - Identify objectives
 - Determine risk drivers
- Agile Risk Assessment
 - Assess against risk drivers (Threats and Opportunities)
 - Risk profile / burn-down
- Integrate Risk Management
 - Plan responses
 - Risk board
 - Acceptance criteria

Thank You

13	92%
15	93%
17	94%
20	95%

Sampling at Random

- If you pick what samples to use, you bias the prediction!
- Strategies for proper random sampling –
 - Use something you know is random (dice, darts)
 - Pick two groups using your chosen technique and compute your prediction separately and compare
 - Don't pre-filter to remove "outliers"
 - Don't sort the data, in fact randomize more if possible
